<u>ISSN: 2249-0558</u>

Abstract:

Biometric cryptography is a technique using biometric features to encrypt the data which can improve the security of the encrypted data and can overcome the shortcomings of the traditional cryptography. Biometric features are integrated with the cryptographic techniques for better security and authentication. The proposed work concentrates on the integration of the retinal biometric features with the cryptographic techniques. Reed-Solomon (RS) error correcting algorithm is employed directly to encrypt and decrypt the data. The encrypted data generated using RS code is added to the retinal feature to obtain more secured encrypted data. To decrypt the data, the encrypted data is subtracted from retinal features to get the original data. The performance of the proposed approach is compared with the existing Iris features and the experimental results shows that FAR (False Acceptance Ratio) and FRR (False Rejection Ratio) of the proposed system has been very much reduced. In future, Multimodal Biometrics can be implemented and their performance measures like Failure to Enroll, System throughput and fraud prevention level can be estimated.

Keywords— Biometric features, Feature Extraction, RS Codes, FAR (False Acceptance Rate), FRR (False Rejection Rate).

INTRODUCTION:

In the traditional cryptographic techniques the original data is encoded by using any key so that it is not in understandable format for the attacker. The original data can be obtained by decoding the encoded data using the key. To improve the security and authentication, the biometric features are integrated with the cryptographic algorithms. Recently biometric features play a vital role in personal authentication as they are automated methods of recognizing a person based on a physiological or behavioral characteristic. Some of the features are face, fingerprint, hand geometry, iris, retina, signatures and voice. Retinal features are extracted [5] and integrated with the cryptographic techniques.

A Monthly Double-Blind Peer Reviewed Refereed Open Access International e-Journal - Included in the International Serial Directories Indexed & Listed at: Ulrich's Periodicals Directory ©, U.S.A., Open J-Gage as well as in Cabell's Directories of Publishing Opportunities, U.S.A. <u>ISSN: 2249-0558</u>

In this proposed work, the FAR and FRR values are compared between the two biometric techniques namely Iris [3] and Retina. Further fingerprint [6] is also compared with Iris. Experimental results shows that Retinal features are more secure than the Iris features.

RELATED STUDY:

Hao et al., [1] presented a technique for combining crypto with biometrics effectively. The author proposed a practical and secure way to incorporate the iris biometric into cryptographic applications. The author proposed a two-layer error correction approach that merges Hadamard and Reed-Solomon codes for deliberating on the error patterns within iris codes.

Dutta et al., [2] put forth a network security using biometric and cryptography. The author presented a biometrics based Encryption/Decryption method, in which unique key is generated using partial portion of combined sender's and receiver's fingerprints. A random sequence is produced from this unique key, which is used as an asymmetric key for both Encryption and Decryption

Zhaofeng He et al., [3] presented iris segmentation is an essential module in iris recognition because it defines the effective image region used for subsequent processing such as feature extraction. Traditional iris segmentation methods often involve an exhaustive search of a large parameter space, which is time consuming and sensitive to noise. To address these problems, this paper presents a novel algorithm for accurate and fast iris segmentation.

Cancellable biometrics gives a better performance of security as it facilitates with more than one template for the same biometric data. Ang et al., [6] proposed the measurement of the success of a particular transformation and matching algorithm for fingerprints. A key-dependent cancellable template for the fingerprint was produced by employing a key dependant geometric transform on the obtained fingerprint features.

EXISTING WORK:

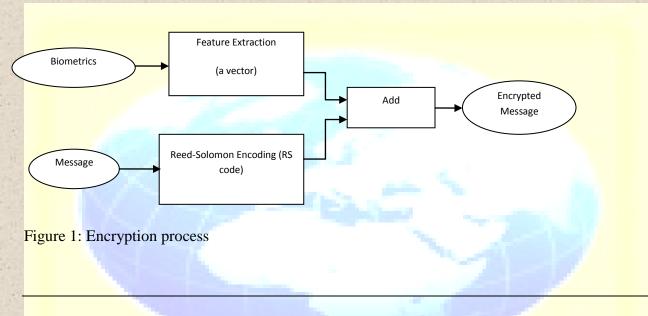

A Monthly Double-Blind Peer Reviewed Refereed Open Access International e-Journal - Included in the International Serial Directories Indexed & Listed at: Ulrich's Periodicals Directory ©, U.S.A., Open J-Gage as well as in Cabell's Directories of Publishing Opportunities, U.S.A. International Journal of Management, IT and Engineering http://www.ijmra.us

The existing algorithm [4] works with Iris as its biometric technology. Encryption and Decryption process works as follows,

ISSN: 2249-0558

A. Encryption Process

The message to be encrypted is undergone a RS Encoding and then the Biometric Feature is added to the encrypted message.

Algorithm 1 : Algorithm for Encryption

Step 1: Extract the feature vector (FV) by inputting the Iris..

Step 2: Compute the (N, K, T) RS codes of the original message, where N, K and T are the length of the RS code, the length of the message and the number of the errors this code can correct, respectively. According to Reed-Solomon algorithm, these three parameters should satisfy K = N - 2T.

Step 3: Add the RS codes to the feature vector to get the encrypted message.

B. Decryption Process

The Decryption is performed by subtracting the encrypted message from the Biometric Feature. Then RS decoding is performed to get back the original message.

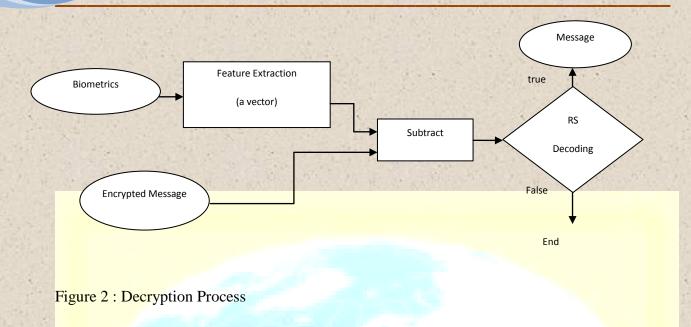

A Monthly Double-Blind Peer Reviewed Refereed Open Access International e-Journal - Included in the International Serial Directories Indexed & Listed at: Ulrich's Periodicals Directory ©, U.S.A., Open J-Gage as well as in Cabell's Directories of Publishing Opportunities, U.S.A. International Journal of Management, IT and Engineering http://www.ijmra.us

2011

Volume 1, Issue 4

Algorithm 2 : Algorithm for Decryption

Step 1: Extract the feature vector (FV') by inputting the Iris.

Step 2: Subtract the feature vector from the encrypted message to get the noisy RS Code.

Step 3: Correct the error in the noisy RS Code using the standard Reed-Solomon.

II. **PROPOSED WORK**

In the proposed work the Iris is replaced with the Retinal feature. The proposed algorithm also has two processes namely encryption and decryption process and works as follows,

Algorithm 3 : Algorithm for Encryption

A Monthly Double-Blind Peer Reviewed Refereed Open Access International e-Journal - Included in the International Serial Directories Indexed & Listed at: Ulrich's Periodicals Directory ©, U.S.A., Open J-Gage as well as in Cabell's Directories of Publishing Opportunities, U.S.A. International Journal of Management, IT and Engineering http://www.ijmra.us

Step 1: Extract the feature vector (FV) by inputting the Retina.

Step 2: Compute the (N, K, T) RS codes of the original message, where N, K and T are the length of the RS code, the length of the message and the number of the errors this code can correct, respectively. According to Reed-Solomon algorithm, these three parameters should satisfy K = N - 2T.

ISSN: 2249-0558

Step 3: Add the RS codes to the feature vector to get the encrypted message.

Algorithm 4 : Algorithm for Decryption

Step 1: Extract the feature vector (FV') by inputting the Retina.

Step 2: Subtract the feature vector from the encrypted message to get the noisy RS Code.

Step 3: Correct the error in the noisy RS Code using the standard Reed- Solomon.

Thus the proposed algorithm works with Retinal features to enhance the degree of security. The degree of security is measured using the factors like FAR (False Acceptance Ratio) and FRR (False Rejection Ratio)

III. EXPERIMENTAL RESULTS

The proposed retinal feature is experimented using two datasets namely,

- Real Time Retinal data set [http://www.sinobiometrics.com]
- DRIVE dataset. [http://www.isi.uu.nl]

The results are measured using two measures like FAR (False Acceptance Ratio) and FRR (False Rejection Ratio)

A Monthly Double-Blind Peer Reviewed Refereed Open Access International e-Journal - Included in the International Serial Directories Indexed & Listed at: Ulrich's Periodicals Directory ©, U.S.A., Open J-Gage as well as in Cabell's Directories of Publishing Opportunities, U.S.A. International Journal of Management, IT and Engineering http://www.ijmra.us

A. Real Time Retinal data set:

100 persons retinal images are sampled and the following FAR and FRR results are obtained.

Table 1 show the resulted False Rejection Rate (FRR) for the various biometric techniques.

TABLE 1

False Rejection Rate (FRR) (%) Comparison for Real Time Retinal data set

Use	r	Fingerprint	Iris	Retina
1-10)	9.5	6.2	4.1
11-2	20	9.1	7.5	3.4
21-3	30	8.9	6.2	3.5
31-4	40	8.2	7.1	3.24

11-20	6.43	4.92	1.22
21-30	6.5	4.93	1.35
31-40	6.48	4.9	1.28

Table 5 shows the overall average FAR and FRR comparison of the biometric techniques for DRIVE dataset.

TABLE 5

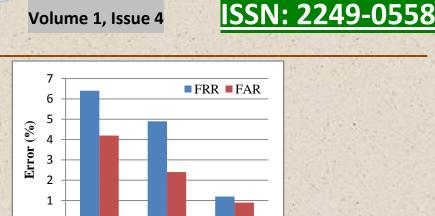

Overall average FAR and FRR Comparison

Evaluation Measures	Fingerprint	Iris	Retina
FAR	4.2	2.4	0.9
FRR	6.4	4.9	1.2

From the figure 3, it is clearly observed that, the FAR of the proposed retinal cryptographic technique is 0.9%. But the FAR for the existing fingerprint and iris techniques are 4.2% and 2.4%.Similarly, FRR for the retinal cryptographic technique is 1.2% and the FAR for the existing fingerprint and iris techniques are 6.4% and 4.9%

A Monthly Double-Blind Peer Reviewed Refereed Open Access International e-Journal - Included in the International Serial Directories Indexed & Listed at: Ulrich's Periodicals Directory ©, U.S.A., Open J-Gage as well as in Cabell's Directories of Publishing Opportunities, U.S.A. Volume 1, Issue 4

FRR ■FAR 0 Fingerprint Iris Retina

Figure 3 : Comparison of FAR and FRR of the Biometric Techniques

From the result, it can be observed that the cryptographic algorithm technique based on retinal features results in lesser FAR and FRR for all the persons, whereas the other biometric techniques like fingerprint and iris results in higher percentage of FAR and FRR.

The percentage of improvement of the proposed approach in terms of FAR and FRR is **1.5 and 3.7 compared to Iris.**

TABLE 6

Evaluation Measures	Retina Improvement %
FAR	1.5
FRR	3.7

Percentage of Improvement

CONCLUSION:

This work mainly overcomes the drawbacks of the traditional cryptographic algorithm which uses only the cryptographic keys for the encryption and decryption process. The existing work uses Iris as the biometric measure to enhance the degree of security. In the proposed approach Retina replaces the Iris features and experimental results shows that the security of the message is increased when compared to the existing work. Such approach is used in highly secured system.
