Effect Of Social Environment Factors And Entrepreneurship Development Programs On Prospects Of Women Entrepreneurship: A Study Of Women Entrepreneurs From Punjab, India

Leena Malhotra *, Dr.Rakesh Kumar **, Dr.Raminder Pal Singh ***

Abstract

The primary objective of this research is to examine the impact that women's social and economic circumstances have had on their decision to start their own businesses. The ongoing investigation used a descriptive research design for its methodology. Regarded as the demographic for the purpose of the research, female business owners from all over the Malwa Punjab region are taken into account. In the first step of the sample process, which consisted of choosing the districts to be examined, a probability sampling approach, like the multistage sampling technique, was utilised. In the second process of the study, random sampling & non-probability sampling were both utilised in order to choose the female business owners who would later serve as respondents. The questionnaire answers of 525 individuals from a selection of districts were analysed for this research. For the purpose of this investigation, the researchers have decided to use descriptive and inferential statistics and the garret ranking technique as their despite evidence to the contrary to data analysis. According to the findings of the research, sociocultural elements and entrepreneurship development programmes both have an effect on the number of women who start their own businesses.

Keywords: Entrepreneurship, Malwa Region, Women.EDP, Garret Ranking, Entrepreneurs, MSME

Introduction

This is the "golden age of women in business," but it couldn't have come at a better time. Women are increasingly realising their potential as company owners. Women's corporate management and entrepreneurship provide a rare opportunity for eliminating long-standing roadblocks. Women are challenging stereotypical masculine fields by pushing beyond boundaries and venturing beyond their comfort bubble. From the entertainment industry to the IT sector, women confront discriminate on the grounds of their gender at every turn. Women make up around 14% of all entrepreneurs, or 8.05M from a total of 58.5M, according to the All-India report of the sixth industrial census (2013). This includes 2.76 million females, or 13.76% of the skills and work. According the source, out of a total of

8,03,985 companies in Punjab, only 17,843 are owned by women. This amounts to only 2.22 %. Women business owners have made significant strides in the previous 20 years, and they still have a bit of a way to go.

Industrial Scenario of Punjab

As on 31st March 2011, there are 386 Medium and large-scale industries registered in the state having turnover of Rs 105638.84 crore and have provided employment to about 211753 persons. In addition, 150040 registered small-scale industries are having a turnover of about Rs. 44249.20 crore and employed about 916611 persons. District-wise distribution of MSME units, turnover and employment is depicted in table 1.

engineering repair shops, automobile repair repair shops, printing companies, and teaching approach. These companies may be found across the province of Punjab, operated by both male and female entrepreneurs.

Literature Review

Great businessmen, as according Pandit (2000), need a feeling of accomplishment, satisfaction, and the drive to show their commercial acumen via innovation. When asked what drove their business decisions, women entrepreneurs cited support from their spouses, parents, friends, and bank and financial institution officials (Lakshmi, 2003). Kumar (2005) conducted a study in Delhi to learn more about the kind of companies run by women there, the barriers they faced when starting out, and the ways in which they raised capital. According the results of the research, in order to be a successful businessman, one must get education; thus, a training programme that can boost women's confidence should be created. Women business owners generally struggled with problems related to marketing and funding. Moreover, there are several holes as well as restrictions in the current financing schemes. Unemployed, the need for financial freedom, the need to do something helpful, lucrative use of available leisure, as well as a readiness to do business were identified by Roy (2007) as the key push and pull factors encouraging their choice of an entrepreneurial career. In this essay, Siddique (2008) This research set out to address the underrepresentation of women in business by exploring their challenges and opportunities. The survey concluded that poor access to financing was the most serious obstacle to women business owners. Women business owners also struggled with issues included inadequate marketing resources and finding a work-life balance that allowed them to focus on both their businesses and their families. The research found that women in Bangladesh are underrepresented in business but that this may change if they were given access to training programmes and need-based financial and allied support. Private companies and organizations both have substantial responsibility for fostering women's company ownership and success. Women's business and equality will not progress until these intermediaries are in place. As according Reddy (2010), the respondents' inspiration to begin their own businesses came from a variety of sources, including a desire for autonomy and independence, a knack for business, a knack for making money, a track record of working for themselves, the advice of friends and family, as well as personal experience. Billore (2011) examined the possibilities for female entrepreneurs amongst India's diaspora in Japan. This study is grounded on conversations with three business

owners during the start-up phase. Respondents were initially seen as housewives by the author, but she found that during the course of their time in Japan, they lost that image, developed their skills, and took on new responsibilities without sacrificing their family responsibilities or creating jobs for Japanese or foreigners. Lack of government efforts, socio-cultural pressures, and support facilities were major obstacles faced by women entrepreneurs. Issues including native employee and ethnic owner connections, money availability, institutional support, and legal hurdles are areas where additional study is needed, in her opinion. Women's entrepreneurship in India was studied by Asharani and Sriramappa (2014). The research found that problems with gather insights, marketing, technology, project planning, infrastructure, training, etc. were the most common challenges women business owners encountered. When Velmurugan (2015) investigated the challenges faced by female business owners in the PollachiTaluk of the Coimbatore District, she found that issues with marketing were by far the most prevalent, followed by issues with funding and production. When it came to accounting careers in China, women face unique challenges, which Zhao as well as Lord (2016) investigated. According the authors, female cpas in China faced sexism and other forms of prejudice at every career stage. The biggest obstacle was a bleak outlook about a woman's ability to return to work after having a child. In addition, the authors state for the enactment of the law in China to ensure that women had equal access to job opportunities, particularly promotion as well as hiring. Mulatu and Prasad (2016) identified the factors that contribute to the success of women business owners, including support from family, business acumen, the motivation to aid families, as well as the ability to learn from setbacks. "Problems and Prospects of Women Entrepreneurship having Special Reference to MSMEs in the District of Gujrat" was the topic of Singh's (2017) research. The study revealed that all the factors i.e. education, inner zeal & will power and family played their role in motivating the businesswomen. According to Mozammel and Zaman (2018), women entrepreneurs need both intrinsic and external drive in order to become ego and self-critical to the point in which they can passionately set objectives as well as realise them. Katekhaye (2018) focused on motivating factors, challenges and problems faced by rural entrepreneurs, Government policies, possibilities of rural entrepreneurship development and perspectives in India and Hungary. This research showed that rural entrepreneurship development initiatives were deficient in Indian and Hungarian rural areas. Similarly,

rural entrepreneurship development services were also lacking in the city. Rural entrepreneurs in India and Hungary were lacking business development services such as finance and infrastructure and entrepreneurship education and training, etc.

In light of the data presented above, an effort was made to investigate the impact that a number of socioeconomic factors and EDPs have had on women's propensity to establish their own companies, with the main goals in mind:

Objectives of the Study

The following are the goals which the research aims to accomplish. They are:

- 1. To study the influence of socialenvironment factors on women entrepreneurship.
- 2. To identify impact of entrepreneurship development programmes on prospects of women entrepreneurship.

Research Methodology

Both descriptive and analytical descriptive methods were used in this investigation. A probabilistic sampling strategy, including such multistage sampling, has been used in the first phase to select the districts again for research. The women entrepreneurs were chosen as respondents in the second stage using both probability and non-probability sampling methods, such as the snowball sampling approach. Samples were gathered from the DIC's registered women entrepreneurs. Aside from that, women entrepreneurs were surveyed via snowball sampling. Mansa, Moga, Rupnagar, Ferozepur, Muktsar, Fategarh Sahib, and Sangrur were among the 7 districts in Punjab's Malwa District from which 525 female entrepreneurs were drawn for this study.

The above table and figure display the areas of Entrepreneurship Development Programmes that have favourable impact on the prospects of women entrepreneurship ten variables were assessed. The women were asked the areas in which entrepreneurial development programmes have favourable impact on women entrepreneurship, the common were stated is to attain managerial skill with a high average of 63.26. On an average 61.72 said identification of enterprise management motivated them to choose the entrepreneurship development programme with second rank. Human resource development and technical skill management were stated as the third and fourth area. On an average 57.58 and 46.39 women opine that their identification of business opportunities and information technology influenced them choose entrepreneurial development programme; it is ranked in the fifth and sixth places. Stress management and increasing social recognition to women were stated as the seventh and eighth reasons for attending EDPs. Total quality management and any other reason were stand in the ninth and tenth rank.

Conclusion

As per the field survey it was found thatmajority of the women entrepreneurs said that social environment factorshave influence on women entrepreneurship. According to the mean score analysis, respondents' desire for parity with men is a crucial factor in the selection to pursue entrepreneurship. Next comes the desire for recognition from peers as well as financial autonomy. Results showed that many of the women business owners surveyed in the Malwa Region of Punjab agreed that the entrepreneur development programme had a positive effect on women business owners inside the areas they had selected to participate in the study and further concluded that the areas of Entrepreneurship Development Programmes that have favourable impact on the prospects of women entrepreneurship. Based on the mean scoring analysis Managerial skill, Enterprise Management and Human resource development were the leading areas of Entrepreneurship Development Programmes that have favourable impact on the prospects of women entrepreneurship.

Suggestions

According to the researchers, changing people's mindsets is necessary in order for women to perform well in the economic field. The environment should be free of barriers to boosting the necessary skills of such women in order to improve their market competitiveness. Various government entities should make the most up-to-date technology
