INTRODUCTION

Today, large companies invest twice as much in developing economies as in developed countries. Despite the growth of investment flows in fast-growing countries, factors such as stock market capitalization, transparency, liquidity, stock price volatility and high transaction costs make it difficult to use the optimal method of asset valuation. The sharp fluctuations of assets in the world stock markets are explained by the fact that the level of capitalization of stock markets in developing countries is growing from year to year. However, the mechanism of issuing securities and selling them on the stock market is not used effectively.

LITERATURE REVIEW

The modern concept of the stock market and its role in the stage of socio-economic renewal of society, as well as the problems of the secondary stock market and their solutions will be discussed. In particular, E.Zhukov writes: "Currently, there are three markets in which securities are involved in financing the economy: over-the-counter, stock (exchange) and street" [1].

Specific functions of the stock market include: the distribution and redistribution functions, which in turn can be divided into four groups [2]:

- distribution and redistribution of financial resources between sectors and branches of market activity;

- Transfer of funds, first of all, population savings from non-production to production;

- to cover the existing deficit of the state budget in a non-inflationary way, ie without issuing additional money supply;

- money supply management.

The stock market can be considered a barometer of the socio-economic situation in the country, as it affects the movement of the economic cycle and changes not only in economic processes, but also in the political situation [3].

It solves the problem of covering the non-productive costs of the state budget by reducing the amount of excess money in circulation by issuing various instruments of the stock market (for example, government securities). It should be noted that securities are synonymous in content because they are a type of financial instrument, but they differ in some respects from other types of financial instruments [4].

RESEARCH METHODOLOGY

Methods such as comparison, induction, deduction, analysis, and synthesis have been used to study and analyse the stock market.

ANALYSIS AND RESULTS

The stock market is a set of financial relations in the field of securities issuance and sale, as well as the circulation of securities, the main task of which is the launch of the "fundinvestment" mechanism, collection and distribution of financial resources required for production and technical development, ensuring the modernization of the economy by attracting investments of legal entities and individuals, increasing it and directing it to the sectors of the economy. The stock market and the intermediaries operating in it are also part of the financial system, allowing the redistribution of surplus funds from investors to consumers.

On the one hand, the stock market - capital suppliers, individuals with free funds, legal entities and individuals wishing to invest and increase these funds, as well as government participation. On the other hand, there are market entities that need start-up or additional capital to start a new production, provide work, services, or modernize, expand, or renovate production. It should be noted that enterprises, organizations, the population, as well as the state can directly participate in the application for capital.

Today, especially in a pandemic, many countries need to issue sovereign bonds. At the same time, the countries are using the funds received to support certain sectors, as well as to address the negative consequences of the COVID-19 pandemic. One month after the World Health Organization (WHO) declared COVID-19 a global pandemic (March 11, 2020), weekly sovereign bond issuance rose nearly \$ 20 billion USD. For example, Israel has issued a total of \$ 5 billion in sovereign bonds to combat COVID-19. The Government of the Kingdom of Bhutan has pledged \$ 41 million at an annual coupon rate of 6.5 percent to support the financing of financial needs against the COVID-19 pandemic [5].

According to the International Capital Markets Association (ICMA) in August 2020, the US (22.4 trillion US dollars), China (19.8 trillion US dollars) and Japan (12.4 trillion US dollars) were traded in the SSA bond market. Sovereign bonds account for 73% of the SSA bond market (\$ 63.7 trillion). In particular, sovereign bonds in the U.S. SSA bond market totalled \$ 20 trillion and China's SSA bond market was worth \$ 7 trillion [6].

The stock market also performs a number of important macro and microeconomic functions in a developed economy.

First, the stock market acts as a coordinator of investment flows, ensuring the optimal structure of resource use for society. It is through the stock market that the bulk of capital inflows take place in industries with a higher rate of return on capital investment. The stock price in the secondary market, which fluctuates based on supply and demand in the market (of course, investors try to get rid of low-yielding securities by directing their funds to more profitable projects), which is important for production. determines the price of the primary market. Businesses will be able to get the capital they need to grow only in the primary

market. In developed markets, the success or failure of a start-up depends on the attitude to its securities, that is, the rate of acquisition.

Second, the stock market provides for the mass nature of the investment process. That is, it allows a volunteer economic agent with free cash to invest in production by purchasing securities. The concentration of securities turnover between stock exchanges and professional intermediaries allows the investor to facilitate the investment process.

Third, the stock market quickly reflects changes in the social, political, foreign economic and other spheres of society. In this regard, the general state of the stock market is a key indicator when considering the economic situation in the country as a whole. A narrow analysis of the situation in the stock market can be used to assess the performance of a particular region, industry and a particular enterprise.

Fourth, securities demonstrate the democratic principles of micro-economy management. For example, when a stockholder makes a decision by voting, that is, when one vote corresponds to one stock, the stockholder who has more stocks is more likely to make decisions immediately (expeditiously).

Fifth, the state implements its structural policy by purchasing stocks in individual enterprises. It buys the stocks of strategic enterprises and thus invests in production that is important for the development of society.

Sixth, the stock market is an important tool of public fiscal policy. The main tool for this function is the government securities market. The government, through the stock market, influences the money supply and the growth or decline of GDP [7].

In 2019, there were significant changes in stock market indicators, both quantitatively and qualitatively. This is evidenced by the growth of exchange turnover, the acceleration of transactions, the development of all infrastructure serving the stock market, as well as the improvement of legislation and coordination. All this serves to increase the interest of stock market participants and the general public in the stock market.

By increasing the financial stability and investment attractiveness of joint-stock companies and ensuring the integration of the domestic stock market with foreign stock exchanges, it will be possible to attract investment from global markets.

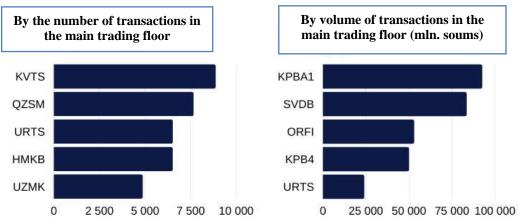

Figure 1. Top-5 Securities of RSE "Tashkent"¹

Figure 1 shows the top 5 securities of RSE "Tashkent" in terms of the number of transactions on the trading floor of JSC "Quartz", JSC "Qizilqumsement", JSC "Commodity Exchange of the Republic of Uzbekistan", JSC "Hamkorbank" and Metallurgy of Uzbekistan.

¹<u>https://www.uzse.uz/boards/2848</u>- information of "Toshkent" RSE website

The stocks of JSC AJ have the highest performance. In terms of the volume of transactions on the main trading floor, the stocks of Kapitalbank JSCB, Savdogar Bank JSCB, Orient Finance JSCB, JSC Commodity Exchange of the Republic of Uzbekistan took the highest place.

We analyze the dynamics of the stock price of some of the above-mentioned jointstock companies on the stock exchange (Table 1).

| 28.02.2022 | 3950 | -161 | 4099,99 | 4100 | 3950 |

In the Table 2, if we look at the stock prices of KvartsJSC, the price of these stocks fluctuated between 3200-4300 soums.

CONCLUSIONS

Based on the above, the following conclusions can be made about the organizational features ofstock markets.

1. Attracting investments through the stock market is a tool based on market mechanisms of investment financing, which is a convenient tool for effective investment attraction. The implementation and development of reforms in the stock market will pave the way for the full intensification of investment activity.

2. At a time when the stock market is an important and basic means of attracting investment in developed countries, the stock market in the country is underdeveloped, as a result of its inability to allocate and redistribute financial resources, businesses and the population prefer the credit market. The participants need to study issues such as the limitation of commercial banks and joint-stock companies with high state share, the low attractiveness of joint-stock companies in the national stock market for foreign investors and improve the conceptual framework for stock market development.

3. Given the complexity and cost of listing requirements in the stock market, there are a number of problems in activating securities trading, the creation of opportunities for efficient use of the system will lead to an increase in trade turnover in the market.

4. It is essential to take into account the urgency of the process of attracting foreign investment through the sale of stocks of domestic joint stock companies in major foreign stock markets.
